Office Action Summary

Application No.

09/186,584

Applicant(s)

Greenfield et al

Examiner

Richard Lee

Art Unit

2613

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136 (a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on Jul 8, 2002.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11; 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-35 is/are pending in the application.
- 4a) Of the above, claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-35 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claims _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgement is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

*See the attached detailed Office action for a list of the certified copies not received.

- 14) ☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. § 119(e).
a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892) 4) ☐ Interview Summary (PTO-413) Paper No(s). _____
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948) 5) ☐ Notice of Informal Patent Application (PTO-152)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s). _____ 6) ☐ Other:

Art Unit: 2613

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

2. Claims 1-6, 16-19, 32, and 34 are rejected under 35 U.S.C. 102(e) as being anticipated by Greenfield et al of record (5,760,836).

Greenfield et al discloses a FIFO feedback and control for digital video encoder as shown in Figures 1 and 5, and the same method and encoder as claimed in claims 1-6, 16-19, 32, and 34 for encoding a digital video image stream in the encoder (see Figure 1), comprising means (21 of Figure 1) for spatial compression of still images in the digital video image stream and means (41 of Figure 1) for temporal compression between the still images, wherein the means for spatial compression comprises means for converting a time domain image of a macroblock to a frequency domain image of the macroblock (see column 1, lines 55-63), means for taking a discrete cosine transform of the frequency domain image (see column 1, lines 55-63), means for transforming the discrete cosine transformed macroblock image by a quantization factor (see 23 of Figure 1), and means for run length encoding the quantized discrete cosine transformed macroblock image (see 25 of Figure 1), wherein the means for temporal compression comprises means for reconstructing the quantized, discrete cosine transformed image of the macroblock (see Figure 1), means for searching for a best match macroblock, and means for constructing a motion vector therebetween

Art Unit: 2613

(see column 6, line 55 to column 7, line 11), the encoder for encoding thereby forming a bitstream comprising run length encoded, quantized, discrete cosine transformed macroblocks and motion vectors and passing the bitstream to and through an external buffer to a transmission medium (see column 6, line 55 to column 7, line 11), comprising means for feeding back to hardware logic (i.e., as provided by the buffer management system of Figure 5) within the encoder an external read signal from a host (see 51 and FIFO_RD of Figure 5, and columns 5-7), and for incrementing an on-chip counter of the hardware logic each time that the external buffer is read and calculating therefrom the number of bits read by a host (see column 5, lines 31-50), the hardware logic in the encoder being further adapted to monitor a number of bits encoded and written into the external buffer and subtract from the number of bits encoded the number of bits read by the host to continuously obtain the fullness of an external buffer, wherein the continuously obtaining comprises obtaining the fullness of the external buffer every cycle of the encoder (i.e., by having a real time encoding system, real time fullness of the external buffer is maintained every cycle of the encoder, see column 1, lines 32-49, column 5, lines 24-30, lines 53-59), and wherein the hardware logic in the encoder is further adapted to provide the host with a dynamic buffer level indicator in real time indicative of the fullness of the external buffer (i.e., the external buffer BF is being monitored until the bitrate is adjusted to meet the criteria $BF < L$, with the amount of time the bitrate being adjusted changed as desired using microcode, thereby providing a dynamic buffer level indicator, see column 5, lines 24-67, columns 6-7); wherein the logic adapted to provide the host with a dynamic buffer level indicator comprises logic adapted to continuously compare the

Art Unit: 2613

real time fullness of the external buffer (i.e., by having a real time encoding system, real time fullness of the external buffer is maintained, see column 1, lines 32-49, column 5, lines 24-30, lines 53-59), with a buffer threshold defined by the host and to provide a high level indicator when the buffer fullness is greater than the buffer threshold and a low level indicator when the buffer threshold is greater than the buffer fullness (see column 6, lines 18-29); further comprising a buffer threshold register (153 of Figure 5) within the encoder coupled to the logic adapted to compare the buffer fullness to the buffer threshold, wherein the external buffer comprises at least one FIFO buffer (see column 1, column 6, lines 18-45, and Figure 5); an external buffer configuration register (151 of Figure 5) in the encoder for retaining multiple external buffer configuration values, and wherein the calculating in the encoder the number of bits read by the host includes employing a predefined configuration value of the external buffer configuration register in determining the number of bits read by the host upon receipt of each buffer read signal from the host, and wherein the multiple external buffer configuration values retained in the external buffer configuration register comprise at least some of 1, 2, 4, and 8 byte buffer configuration values, each value being representative of a number of bytes read from the external buffer with each buffer read signal from the host for a respective external buffer configuration (see column 5, lines 31-50).

Art Unit: 2613

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 7-15, 20-31, 33, and 35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Greenfield et al as applied to claims 1-6, 16-19, 32, and 34 in the above paragraph (2), and further in view of Choe et al of record (6,094,696).

Greenfield et al discloses substantially the same method and encoder for encoding a digital video image stream in the encoder as above, further including wherein the external buffer comprises one of a field buffer or cascaded FIFO buffers (see Figure 5), continuously comparing the fullness of the external buffer to a predefined buffer size and providing the host with a high level indicator when the buffer fullness is greater than or equal to the buffer size and a low level indicator when the buffer size is greater the buffer fullness, and providing an on chip buffer size register for holding a host defined buffer size value for use in the comparing of the buffer fullness to the buffer size (see columns 5-6).

Greenfield et al does not particularly disclose, though, providing from the encoder to the host in real time a dynamically updated flag comprising at least one of a buffer empty flag, a buffer almost full flag and a buffer full flag as claimed in claims 7-11, 13, 20-22, 24, 27, and 29-31.

However, Choe et al discloses a virtual serial data transfer mechanism and teaches the conventional use of a buffer management system wherein buffer full and buffer empty flags are set

Art Unit: 2613

(see column 2, line 62 to column 3, line 56). Therefore, it would have been obvious to one of ordinary skill in the art, having the Greenfield et al and Choe et al references in front of him/her and the general knowledge of flag indicating statuses for a buffer management system, would have had no difficulty in providing the dynamic buffer flagging system as taught by Choe et al as part of the buffer management within Figure 5 of Greenfield et al for the same well known flag identification purposes as claimed.

5. Regarding the applicants' arguments at pages 17-18 of the amendment filed July 8, 2002 concerning in general that "... Greenfield et al fails to uncover any teaching, suggestion or implication that the processing or logic described therein comprises a dynamic buffer level indicator that is provided as recited by applicants herein. In fact, Greenfield et al specifically describes a non-real time buffer level indicator. In Greenfield et al the buffer level indicator is provided dependent upon how often the processor updates the indicator. The hardware described in Greenfield et al would be incapable of supporting a continuously obtaining application as recited herein ... This means that the processor is doing the updating of the buffer level indicator and that the buffer level signal is not returned on a continuous basis. As one example, in the Greenfield et al system, a buffer level indicator would be returned approximately once per picture frame. In contrast, applicants' hardware logic continuously obtains the fullness of the external buffer ... it is implemented in microcode, and therefor, buffer fullness is not constantly monitored ...", the Examiner wants to point out that though Greenfield et al uses a microcode operation for detecting overflow, Greenfield et al is nevertheless also interested in continuously obtaining the

Art Unit: 2613

fullness of the external buffer BF. Greenfield teaches that the external buffer BF needs to be monitored to thereby provide an adjusted bitrate satisfying the criteria $BF < L$ in order to prevent buffer overflow (see column 5, lines 24-67). In order to meet the criteria $BF < L$, the fullness of the external buffer BF would inherently have to be continuously monitored. Otherwise, buffer overflow results. Therefore, it is submitted again that Greenfield et al (see column 5, lines 24-30, lines 53-67) shows the same hardware logic in the encoder being adapted to monitor a number of bits encoded and written into the external buffer and subtract from the number of bits encoded the number of bits read by the host to continuously obtain the fullness of an external buffer as claimed.

Regarding the applicants' arguments at pages 19-20 of the amendment filed July 8, 2002 concerning in general that "... applicants continuously attain the recited dynamic buffer level indicator through the use of a hardware implementation. Clearly, Greenfield et al describes a microcode implementation, which, based on the processing described therein, comprises a non-continuous implementation. This is understood by one skilled in the art through the use of a non-real time counter to monitor the amount of data written to the FIFOs in Greenfield et al ... However, neither of these columns teaches, suggests or implies a continuous monitoring of external buffer fullness as recited in the independent claims presented herewith. Real time encoding is different from and independent of applicants' recited continuous monitoring of external buffer fullness ...", the Examiner respectfully disagrees. It is again that continuous monitoring/obtaining of the fullness of the external buffer BF is required in order to prevent buffer

Art Unit: 2613

overflow and satisfy the criteria $BF < L$ within Greenfield et al, and with the continuous obtaining of the fullness of the external buffer being determined every cycle of the encoder (see column 5, lines 24-30, lines 53-67, columns 6-7). And it is again that since real time encoding is realized within Greenfield (see column 5, lines 24-30), and the processings and monitorings of the external buffers are provided in real time as taught by Greenfield, applicants' arguments that the microcode implementation of Greenfield comprises a non-real time counter to monitor the amount of data written to the FIFOs is not convincing. For the encoding system of Greenfield et al to be provided in real time as described at column 5, lines 24-30, all components/processings within the encoder must inherently be performed in real time as well.

Regarding the applicants' arguments at pages 20-23 of the amendment filed July 8, 2002 concerning in general that "... each independent claim at issue recites a technique wherein hardware logic within the encoder continuously obtains and provides to the host a dynamically updated flag. Neither Greenfield et al nor Choe et al continuously obtain and provide from encoder hardware to a host a dynamically updated flag ... Greenfield et al fails to uncover any teaching, suggestion or implication of hardware logic implementing a technique wherein a dynamic buffer level indicator is continuously obtained and provided to a host. Similarly, a careful reading of Choe et al fails to uncover any discussion of an encode process, let alone the provision of a dynamic buffer level indicator from an encoder to a host ... Choe et al fails to uncover any dynamic indicator being continuously provided, as disclosed in the present application ... This is in contrast with the flags disclosed by applicants which are dynamic, real

Art Unit: 2613

time indicators ... The flags of Choe et al are used to start data transfer operations ... Applicants flags are used to regulate data rate in and out of the FIFOS in a simultaneous and continuous manner ...”, the Examiner wants to point out that since the external buffer BF of Greenfield et al is being continuously monitored until the bitrate is adjusted to meet the criteria $BF < L$, with the amount of time the bitrate being adjusted changed as desired using microcode (see column 5, line 24 to column 6, line 17 of Greenfield), it is submitted that the hardware logic in the encoder of Greenfield thereby provides to the host with a dynamic buffer level indicator in real time indicative of the fullness of the external buffer as claimed. And since Choe et al teaches the conventional buffer management system with buffer full and buffer empty flags being able to be set (see column 2, line 62 to column 3, line 56), it is submitted that it is considered obvious to provide the buffer flagging system of Choe et al for the buffer management system of Greenfield et al to thereby provide substantially the same if not the same providing to the encoder of Greenfield in real time a dynamically updated flag comprising at least one of a buffer empty flag, a buffer almost full flag and a buffer full flag as claimed. The claimed invention is thereby rendered obvious in view of the combination of Greenfield et al and Choe et al for reasons above.

6. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO**

Art Unit: 2613

MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

7. Any response to this final action should be mailed to:

Box AF

Commissioner of Patents and Trademarks
Washington, D.C. 20231

or faxed to:

(703) 872-9314, (for formal communications; please mark "EXPEDITED
PROCEDURE") (for informal or draft communications, please label
"PROPOSED" or "DRAFT")

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal Drive,
Arlington, VA., Sixth Floor (Receptionist).
